In chemometr:
PCA/MLPCA

MLPCA/TLS
equivalent?

Performance
comparison

Conclusion

Example: near-infrared spectroscopic data

- 31 three-component mixtures containing toluene, chlorobenzene and heptane
- spectra obtained over the range 400-2500 nm

Motivation: mixture analysis

The spectra form a 31×1050 noisy data matrix D :

$$D = \begin{bmatrix} y_1^{(1)} & y_2^{(1)} & \dots & y_{1050}^{(1)} \\ y_1^{(2)} & y_2^{(2)} & \dots & y_{1050}^{(2)} \\ \vdots & \vdots & \ddots & \vdots \\ y_1^{(31)} & y_2^{(31)} & \dots & y_{1050}^{(31)} \end{bmatrix}$$

? : approximation matrix \hat{D} of rank 3.

Conclusion

Classical TLS problem formulation

Given: overdetermined set of linear equations $AX \approx B$

Find: $\min_{\widehat{\Delta A}, \widehat{\Delta B}, \widehat{X}} \|\begin{bmatrix} \widehat{\Delta A} & \widehat{\Delta B} \end{bmatrix}\|_F^2$ s.t. $(A - \widehat{\Delta A})\widehat{X} = B - \widehat{\Delta B}$

\widehat{X} is called a TLS solution and $\begin{bmatrix} \widehat{\Delta A} & \widehat{\Delta B} \end{bmatrix}$ the corresponding TLS correction.

TLS: problem formulation

Classical TLS problem formulation

Given: overdetermined set of linear equations $AX \approx B$

$$\text{Find: } \min_{\hat{D}, \hat{X}} \| D - \hat{D} \|_F^2 \quad \text{subject to } \hat{D} \begin{bmatrix} \hat{X} \\ -I \end{bmatrix} = 0$$

WLRA in chemometrics: PCA and MLPCA method

Given: $D \in \mathbb{R}^{m \times n}$ of true pseudorank r

PCA

Compute: $\hat{D}_{PCA} = \arg \min_{T,P} \| D - \hat{D} \|_F^2 \quad \text{s.t.} \quad \hat{D} = TP^T$

ML if errors in d_{ij} are i.i.d.

Algorithm: truncated SVD

MLPCA

Compute:

$\hat{D}_{MLPCA} = \arg \min_{T,P} \text{vec}^T(D - \hat{D})W^{-1}\text{vec}(D - \hat{D}) \quad \text{s.t.} \quad \hat{D} = TP^T$

ML if true error covariance matrix W is known

Algorithm: Alternating LS

- 4 WLRA in chemometrics: PCA and MLPCA
- 5 MLPCA and TLS equivalent?**
- 6 Performance comparison
- 7 Conclusion

Are (extended)TLS and (ML)PCA equivalent?

Equivalent methods to solve the same kernel problem:

$$\min_{\hat{D}} \text{vec}^\top(D - \hat{D})W^{-1}\text{vec}(D - \hat{D}) \quad \text{s.t.} \quad \text{rank}(\hat{D}) \leq r$$

Set $D = [A \ B] \in \mathbb{R}^{m \times n}$, with true pseudorank r .

Since

$$\begin{aligned} \hat{B} \in \mathcal{R}(\hat{A}) &\Leftrightarrow \exists X : \hat{A} \hat{X}_{\text{TLS}} = \hat{B} &\Leftrightarrow \text{rank}(\hat{D}) \leq r \\ &&\Leftrightarrow \exists T, P : \hat{D} = TP^\top, \end{aligned}$$

we have:

$$\hat{D}_{\text{TLS}} = \hat{D}_{\text{MLPCA}}! \quad \text{YES!}$$
